

Crestone — Installation Acceptance Checklist

Use this checklist end to end for every new Crestone installation with an SAP source. Don't mark a section done just because the UI loaded or the installer showed a success message.

1. Before installing

- ☐ Server meets the minimums (230 GB disk, 16 GB RAM, 8 CPU cores, 4 GB swap), x86_64 architecture
Client infrastructure
- ☐ Ports 80/443/81/7000/22 enabled as needed (see Minimum Technical Requirements)
Client network team
- ☐ Outbound TCP/587 to email-smtp.us-east-1.amazonaws.com (AWS SES) enabled — it's the only outbound port in the whole block; if missing there's no visible error, the confirmation email just never goes out
Client network team
- ☐ If the install starts with just an IP (no custom DNS yet), access is over HTTP, not HTTPS — confirm the client's security policy/proxy doesn't block plain HTTP before assuming “the UI won't load”
Client network team
- ☐ Allowed domains: *.s3.amazonaws.com (always), plus Docker/Ubuntu ones if the server doesn't already have them
Client network team
- ☐ Root/sudo access confirmed on the server
Client infrastructure
- ☐ Decided whether to use the default nip.io hostname or a custom DNS from the start (see the risk of it being blocked by filters like FortiGuard)
Seidor / client
- ☐ If the source is SAP: client's sysnr confirmed, and the network scenario defined (direct access / VPN / SAProuter)
Seidor / Basis

2. Install Crestone

- ☐ install.sh ran without errors and shows the success message
Seidor
- ☐ All containers are Up and healthy (docker compose ps), none stuck in Restarting/Exited
Seidor
- ☐ housekeeping.sh run after installing, to free up the space used by duplicated images
Seidor
- ☐ UI reachable from the configured hostname (nip.io or custom DNS) from the client's normal network, not only from a technical network/VPN
Seidor · confirm with the client

3. Crestone users and licensing

- ☐ License activated (online with a code, or offline with a signed file), limits and expiration matching what was contracted
Seidor

CRESTONE — INSTALLATION ACCEPTANCE CHECKLIST

- ☐ noreply@notifications.crestone.io allowlisted on the company's mail gateway/firewall (once, for everyone)
Client network team
- ☐ Also allowlisted on each invited user's own mailbox rules (M365/Google Workspace can apply different filtering per person or group)
The user / their IT
- ☐ Crestone user created, confirmation email arrived
Seidor · verify with a real signup, don't assume
- ☐ The confirmation link opens and works from the user's normal network, without needing a VPN
Seidor
- ☐ If the client configured their own SMTP (Settings → SMTP instead of Crestone's default): the test send passed
Seidor (optional, if applicable)
- ☐ MFA configured if the client's security policy requires it
Client

4. SAP — role, user, and RFC connection

- ☐ Transport requests (OTs) imported into SAP without errors
Basis
- ☐ Technical user created (Communication or Dialog type)
Basis
- ☐ ZCRESTONE role imported, assigned to the user, and user comparison run
Basis
- ☐ User has S_RFC, RFC_SYSTEM_INFO, and access to the tables/extractors in scope
Basis / Security
- ☐ Port 32NN open from Crestone to the application server
Client network team
- ☐ The SAP host's FQDN resolves via DNS from the VM and from the container (not enough for the IP alone to respond over TCP)
Basis / Client network team
- ☐ Port 33NN open from Crestone to the SAP gateway
Client network team · the most commonly forgotten one
- ☐ If there's a SAProuter: saproutab allows both destinations, dispatcher and gateway
SAProuter administrator
- ☐ reginfo and secinfo authorize CRESTONE_SERVER and the CRES_SLOT_*
Basis
- ☐ Gateway ACLs reloaded after editing the files
Basis
- ☐ Type-T RFC destination created in SM59 and its connection test passes
Basis
- ☐ The connection's Gateway Host field points to the client's real SAP host, not a Crestone/demo server
Seidor · confirm against the real ashost

- ☐ If parallelism will be used: the number of CRES_SLOT_N created in SAP matches what's configured in Settings → Parallel Extraction
Seidor / Basis

5. Connections in Crestone (source and destination)

- ☐ Source connection created in Crestone and its connection test passes
Seidor
- ☐ Destination connection created in Crestone and its connection test passes
Seidor
- ☐ If the destination is cloud-based (Azure/AWS/GCP/Snowflake/Databricks/etc.): that connector's domains confirmed with the client and allowed on their outbound internet access
Client network team

6. Test node, job, and extraction

- ☐ Test node created using the configured source connection
Seidor
- ☐ Node preview returns data
Seidor
- ☐ If the table/extraction is large: filters or Batch by Field were applied before running an unbounded Full
Seidor
- ☐ Test job defined and executed
Seidor
- ☐ The full extraction (not just the preview) completes successfully and the data reaches the destination
Seidor · validate both, not just the preview
- ☐ Data in the destination validated against a known sample
Client validates

7. Monitor

- ☐ The test execution shows up in Monitor → Performance/History with a successful status
Seidor
- ☐ No errors in Monitor → Logs (UI / Engine / SAP tabs) tied to the execution
Seidor
- ☐ If cancelling an execution was tested: Cancel execution works and leaves no residual processes on the SAP side
Seidor (optional, if applicable)

8. Closing

- ☐ No item on this list was marked “done” just because the UI loaded or the installer showed 11/11
Seidor
- ☐ Evidence kept: rows extracted, duration, screenshots of the key screens (no visible credentials/secrets)
Seidor
